The image contains three diagrams illustrating correct forklift operation techniques for loading and unloading goods from a rack:

- Diagram 1 (Left):** Shows a forklift operator loading goods onto a rack. The operator is positioned behind the load, and the load is being pushed into the rack. The caption below reads: "从外侧将货物置于托盘内放入。 Put the goods on cart from the front and push in." (Note: The caption text appears to be a translation error, as the diagram shows pushing from the side/rear).
- Diagram 2 (Middle):** Shows a forklift operator unloading goods from a rack. The operator is positioned behind the load, and the load is being pulled out of the rack. The caption below reads: "从内侧将货物拉出并放在托盘上。多装的车要稍稍前移。 Goods should never be pulled well off the former goods forward, only innermost load(s). More loaded vehicle should move forward." (Note: The caption text appears to be a translation error, as the diagram shows pulling from the side/rear).
- Diagram 3 (Right):** Shows a forklift operator unloading goods from a rack. The operator is positioned behind the load, and the load is being pulled out of the rack. The caption below reads: "外侧的货物被拉出时，紧靠它的车应后退。 When the front goods are taken away, inside cart will push other carts away." (Note: The caption text appears to be a translation error, as the diagram shows pulling from the side/rear).
